

ARGUS

An incident management dashboard I proposed and designed at Adobe

Presented by : Suman Hemant

sumanhemant05@gmail.com

Why I Started This

- **When something broke on our web platform, there was no proper tool to manage it. We simply didn't have a dedicated incident management tool.**
- **To understand an incident, you had to piece it together yourself: which services were hit, what was still open, what had already been fixed.**
- **Getting pulled into a situation room took more steps than it should have.**
- **If you joined late, the only way to catch up was to ask someone who had been there from the start.**

What I Proposed

I wrote up the idea for an incident dashboard with AI built into it and took it to my manager. It was approved, and we started working on it.

The idea was simple. One screen where you can see every CSO across our services, tell straight away what's active and what's resolved, and jump into the situation room from the card itself. Next to it, an assistant you can ask about the incident, instead of hunting down the one person who knows.

Three Things I Cared About Most

01 – Seeing the status without reading

I colour-coded every card, red for active and green for resolved. In the middle of an incident nobody wants to read paragraphs.

02 – Joining in one click

The Join CSO Room link sits on the card itself. Once a case is resolved the link greys out, so nobody ends up in a room that's already closed.

03 – Keeping the assistant on the side

I put the AI chat next to the feed, not on top of it, so you can ask a question and still see new incidents coming in.

What I Wanted It to Change

- One place to look, instead of piecing an incident together from different tools and people.
- Less time between being asked to help and actually being in the room.
- Late joiners can catch up by asking the assistant, not by interrupting the team.
- Less mental load for people who are already under pressure.

How It Came Together

Argus wasn't assigned to me. I noticed the gap, sketched out what a dashboard could look like, and pitched it to my manager. Once it was approved, I worked on the information architecture and the screens: the main dashboard, on-call schedule, CSO overview, the situation room and the AI assistant.

The people I designed for were everyone who deals with incidents through our internal tool: on-call engineers, incident managers and service owners.

Checkout API latency spike

S1 - Active

Join CSO Room

AI summary

Express checkout latency rose after a cache config deploy at 15:22. A matching incident on 14 Oct was fixed by rolling back. Rollback done at 15:41; latency is recovering. **Suggested next step:** keep monitoring for 15 min, then move to Resolved.

New Chat

What's happening with the Express CSO, and has this happened before?

Argus AI

CSO 202512120026-88924 is an S1 on Express: checkout latency rose after a cache config deploy at 15:22.

A similar incident on 14 Oct was resolved by rolling back the cache config in 11 min.

Suggested: roll back to v2.13 and loop in Joel P. (Express eng).

Draft a status update for stakeholders

Argus AI

"We're investigating slower checkout on Express since 15:22. A fix is being applied; next update in 15 min."

If I Took It Further

- Roll it out to more services and see where it breaks.
- Measure how long it takes people to join a room, before and after Argus.
- Let the assistant suggest the next step from past incidents, not just answer questions.
